ALIGNMENTS

```
This peptide is a fragment of human cyclin I which can be specifically recognised by antibodies of the invention. The antibodies are used to detect the presence of cyclin I. Antisense cyclin I polynucleotides are useful for as probes and can be labelled and usef for detection of neurones by hybridisation with mRNA for cyclin I (contained in the neurones and arising by the expression of the cyclin I gene in these cells). The gene can be used for detection of cancer cells by detecting the expression of the cyclin I gene in these
                                                                                                                                                                                                                                                                                                                                                                                             Human cyclin I protein and related (anti:sense) DNA - used for neuron labelling method and cancer cell detection.
                                                                                                                              human; cyclin I; antisense; probe; neurone; cancer; antibody.
             AAW21966 standard, protein, 14 AA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention comprises the amino acid and coding sequences of human proteins that are associated with cell growth, differentiation, and death (GGDD). The DNA and protein sequences of the invention are useful for diagnosing, treating or preventing disorders associated with aberrant expression of CGDD, such as: cell proliferative disorders (e.g. arteriosclerosis, atherosclerosis, burstits, cirrhosis, hepatitis, polycythaemia vera, psoriasis and cancers), developmental disorders (e.g. Cushing's syndrome and hypothyroidism), neurological disorders (e.g. epilepsy, stroke, Alzheimer's disease, Pick's disease, Huntington's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New isolated polypeptides associated with cell growth, differentiation and death, useful for diagnosing, treating or preventing e.g. atherosclerosis, psoriasis, cancers, Alzheimer's disease, AIDS, anemia, diabetes mellitus or infertility.

death (CGDD) proteins and polynucleotides encoding them. The sequences of the invention are useful in diagnosing, preventing and treating disorders agesociated with an abnormal expression or activity of CGDD such as neurodegenerative disorders (e.g. Parkinson's disease, Alzheimer's disease), muscular disorders (e.g. myotonic dystrophy, catatonia), endocrine disorders (e.g. diabetes, Grave's disease), cancers (e.g. endocrine disorders (e.g. diabetes), immunological disorders (e.g. scleroderma, systemic lupus erythematosus, allergies), gastrointestinal disorders (e.g. Crohn's disease), renal disorders (e.g. doodpasture's syndrome), infections (e.g. viral, bacterial, fungal, parastic, protozoal, helminthic), cardiovascular disorders (e.g. atherosclerosis) and hepatic diseases (e.g. cirrhosis). The polynucleotides can be used to create humanised animals or transgenic animals to model human diseases.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This sequence is human cyclin I. Antisense polynucleotides are useful for as probes and can be labelled and used for detection of neurones by hybridisation with mRNA for cyclin I (contained in the neurones and arising by the expression of the cyclin I gene in these cells. The gene can be used for detection of cancer cells by detecting the expression of the cyclin I gene in these cells. Also antibodies specific for the fragments of the protein (especially AAW21966) can be used for detection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  (anti:sense) DNA - used for neuron

Cyclin I is expressed at almost constant levels throughout the cell cycle, and is implicated in controlling cell cycle. Progression and transcriptional control. Cyclins form complexes with cyclin-dependent kinases. CDK2, cyclin-dependent kinases. CDK2, cyclin-dependent kinases. CDK2, cyclin-dependent kinases. CDK2, cyclin-dependent kinases. CDK2, cyclin-dependent kinases. CDK2, cyclin-dependent kinases. CDK2, cyclin-dependent kinases. CDK2, cyclin I, ERH, MSReq, hSReq*-1 and hSReq*-2 (AAY52185-Y52188). CDK2 is expressed late in G1 or early in S phase of the cell cycle, and is pivotal for G1/S transition.

Compositions containing a CDK2 complex, an antibody targeting the complexes and their nucleotide sequences conpect to used therapeutically. The complexes and their nucleotide sequences conpect to used the complex for neoplastic activity by measuring the complex of a modulator of the complex for neoplastic activity by measuring the contact with the complex for neoplastic activity by measuring the contact with the complexes can be used to indicate if the the complex has anti-neoplastic activity. Screening for molecules that modulate the formation of the complexes can be used for treating or preventing a therosclerosis or atherosclerosis or atherosclerosis or treating or preventing cor using a test animal, in which tumour growth or regersesion is measured to constant modulate the function of the complex include cancer, hyperproliferative disorders and atherosclerosis

The invention relates to prostate selective polynucleotides and polypeptides. The polynucleotides are expressed in prostate and are useful as molecular markers, as drug targets, and for detecting, monitoring, preventing or treating diseases and conditions related to prostate, such as prostate cancers. The present sequence represents a prostate specific polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                                                                                                                                                                                                                                                                              in an
                                                                                                                                                                                                               Diagnosing or monitoring transplant rejection, e.g. heart, kidney, liver, pancreas, pancreatic islet, lung, bone marrow or stem cell transplant rejection, in an individual, comprises detecting the expression level of
                                                                                                                                                                                                                                                                                                                     rejection, e.g. cardiar traces to unsquant rejection, in an individual comprises detecting the expression level of one or more genes. The methods, system and kites are useful in diagnosing or monitoring transplant rejection, e.g. heart, kidney, liver, pancreas, pancreatic islet, lung, bone marrow or stem cell transplant rejection, e.g. heart, kidney, liver, pancreas, pancreatic islet, lung, bone marrow or stem cell transplant rejection, in an individual. The method is also useful in assessing the immune status of an individual. The method is also useful in diagnosing and monitoring diseases that involve the immune system, e.g. rheumatoid arthritis, lupus, inflammatory bowel diseases, multiple sclerosis, HIV/AIDS or viral, bacterial or fungal infection. The present sequence represents a protein that is encoded by the mRNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Tumour-associated antigenic target (TAT) polypeptide PRO4605, SEQ:1450.

The invention relates to human tumour-associated antigenic target (TAT) polypeptides, and their related nucleic acids. The TAT polypeptides are overexpressed in cancer tissues compared to normal lissues, and may thus serve as effective targets for the diagnosis and treatment of cancer in mammals. The invention also relates to nucleic acid and polypeptide sequences at least 80% identical to the TAT nucleic acids and polypeptides; expression vectors and host cells comprising a TAT nucleic acid; an antibody specific for a TAT polypeptide; a peptide or organic molecule which binds to a TAT polypeptide; fusion proteins comprising a TAT polypeptide; and methods and compositions for the treatment or TAT polypeptide; and methods and compositions for the treatment or aliagnosis of cancer in mammals. TAT polypeptides, nucleic acids, antibodies, antagonists, binding molecules and compositions are useful for diagnosing or treating a cell proliferative disorder associated with increased TAT expression, particularly cancers such as breast cancer, colorectal cancer, lung cancer, ovarian cancer, liver cancer, bladder cancer, pancreatic cancer, cervical cancer, independent and leukaemia. TAT nucleic acids may further be used as hybridisation probes, in chromosome and gene mapping, in chromosome identification and in gene therapy. The present sequence

```
This sequence represents RDS2 which is a zinc cluster protein which acts as a positive or negative regulator of an active agent in a fungus. The protein molecule is used for reducing resistance to an active agent in a fungus e.g. pathogen fungus including Candida such as Candida albicans, Candida glabrata, Candida kruser, Candida guillier-mondii and Candida dubliniensis; and Aspergillus such as Aspergillus nidulans, Aspergillus fungutas and Aspergillus flavus. It is also useful in vitro as a target for determining resistance of the fungus to active agents. The protein molecule modulates resistance to active agents in fungus that are used as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of
                                                                   Molecule for reducing resistance to an active agent in a fungus, reducer the activity of a zinc cluster protein acting as a positive or negative regulator of an active agent in the fungus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Drosophila; developmental biology; cell signalling; insecticide;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                              8
                                                                                                                                                                                                                                                                       The invention relates to improving the production of a secondary metabolite by a fungus. This involves modulating the expression of at least one ZBC (zinc binuclear cluster protein) gene in a manner to improve the yield of the secondary metabolite. Methods of the invention may be used for improving the production of the secondary metabolite e.g. antibacterial (such as beta-lactam), an anti-hypercholseterolaemic (such as lovastain), an immunosuppressant (such as cyclosporin A), an ergot alkaloid (such as ergotamine), an angiogenesis inhibitor (such as ovalicin), a glucan synthase inhibitor, gliotoxini family of compounds, a fungal toxin, a modulator of cell surface receptor signalling, a plant growth regulator, a pigment, an insecticide, or an antineoplastic compound. The method results in a decrease in fermentor run-time, a decrease in the size of the fermentor required for the production of equivalent amounts of the secondary metabolite, or a decrease in the binance of the fermentor required for the production of such asset that must be handled in downstream processing. The sequences given in records ABP3575-ABP3572 represent ZBC proteins. Note: The sequence of data che the for the production, which translates into decreased
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Also disclosed are the nucleic acid molecules encoding the proteins and antibodies that specifically bind to the proteins. The composition comparising the protein, nucleic acid or antibody is useful for the manufacture of a medicament for treating or preventing N. gonorrhoeae infection, this may be in the form of a vaccine or gene therapy. Sequences given in records ABP76736-ABP81046 represent nucleic acid molecules of the invention
insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

```
The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant auch as maize or soybean. The method of producing a transformed plant having an improved property comprises transformed plant when the recombinant DNA construct and growing the transformed plant where the polynucleotide or polypeptide is useful for improving plant properties. The recombinant DNA construct is useful for improving plant properties. The recombinant DNA construct is useful for improving plants with improved plant properties, e.g. improved colld, heat or drought tolerance, tolerance to herbicides, extreme osmotic conditions, pathogens or pests, increased resistance to plant disease, better growth rate by modification of the conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             of the cell cycle pathway with plant growth regulators, increased rate of homologous recombination, modified seed oil or protein yield and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     content, improved yield by modification of carbohydrate, nitrogen or hosphorus use and/or uptake, by modification of photosynthesis or by providing improved plant growth and development under at least one stress condition, improved lignin production or improved galactomannan
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        production. This sequence represents a bacterial polypeptide used in the scope of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic

Conjugates of the protein with a ligand may be used to kill target cells (i.e. those to which the ligand component binds specifically) or to inhibit proliferation of tumour cells. Typical applications include the treatment of cancer, viral infections, malaria, trypanosomiasis, infiammatory or autoimmune diseases, including in vitro purging of e.g. bone marrow. See also AAR74210-7. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                              New ribosome inactivating protein bryodin-2 and related conjugates - for killing target cells, e.g. in treatment of cancer, also related nucleic acid, vectors and transformed cells.

The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain caction (PCR) primers, oligomers, and for chromesome and gene mapping, and in recombinant production of [II]. The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed consists of (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is cusful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders of sites expressing (II). (I) and (II) are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders polypeptide and polymucleotide sequences thoughted in diagnostics, forenaics, gene mapping, identification of mutations diagnostics, forenaics in sorther traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WHOD at electronic format directly from WHOD at electronic format directly from WHOD at electronic format directly from WHOD at electronic format directly from WHOD at electronic format directly from WHOD at electronic format directly from WHOD at electronic format directly from WHOD at electronic format directly from WHOD at electronic format directly from WHOD at electronic format directly from WHOD at electronic format directly from WHOD at electronic format directly from WHOD at electronic format directly from WHOD at electronic format directly fro
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Description
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Seq

Patent No. 6218115
GENERAL INFORMATION:
APPLICANT: TAKESHI NAKAMURA
ITILE OF INVENTION: HUMAN CYCLIN I AND GENES ENCODING SAME
NUMBERS OF SEQUENCES:
CORRESPONDENCE ADDRESS:
ADDRESSEE: PILLEBUTY, MADISON & SUTRO
STREET: 1100 NEW YORK AVENUE, N.W.
CITY: WASHINGTON
STATE: D.C.
COUNTRY: U.S.A.
ZIP: 20005
COMPUTER READABLE FORM:
MEDIUM TYPE: FLOPPY DISK
COMPUTER: BIM PC COMPATIBLE
OFFRATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: PATENTIN RELEASE #1.0, VERSION #1.25
CURRENT APPLICATION DATA:
APPLICATION NUMBER: 32,011
RESTRENCE/DOCKET NUMBER: 32,011
RESTRENCE/DOCKET NUMBER: 32,011

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Description

"EXPIREBSION Of a novel isoform of cyclin I in human testis.";

"Expression of a novel isoform. 249:56-60(1998).

1- TISSUE SPECIFICITY: Highest levels in adult heart, brain and skeletal muscle. Lower levels in adult placente, lung, kidney and pancreas. Also high levels in fetal brain and lower levels in fetal lung, liver and kidney. Also abundant in testis and thyroid.

Tetal lung, liver and kidney. Also abundant in testis and thyroid.

--- DEVELOPMENTAL STAGE: Expression is independent of the cell cycle
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

Clone name at Harvard Institute of Proteomics
(www.hip.harvard.edu): FLH131015.01L
This CDS clone is part of a collection of human full ORF clones
jointly setablished and verified by the Harvard Institute of
Proteomics (HIP) and RZPD.
This CDS has been cloned without stopcodon.
The CDS has been inserted into pDONRZO1 via a BP Clonase(TM)
reaction. Additional sequence has been added in front of the start
codon: att. .AAAAAA GCA GGC TCC ACC (ATG).
The last codon is followed by the 3' att site: GACCCAGCTTTCTT. .att
The clone is validated by full sequence check.
Compared to the reference sequence NM 006835 (GI:17738314) we found
AA exchange(8) at position (first base of changed triplet):
223(arg->gly) 409(lys->arg)
